Algorithm Design M. T. Goodrich and R. Tamassia John Wiley & Sons Solution of Exercise C-1.8 Since r is represented with 100 bits, any candidate p that the eavedropper might use to try to divide r uses also at most 100 bits. Thus, this very naive algorithm requires 2 100 divisions, which would take about 2 80 seconds, or at least 2 55 years.

In this paper an extended algorithm using well-known solution methods for monetary models characterized by rational expectations and optimal monetary policy design is given. The extension enables first the use of broad dynamic interdependencies within the structural model of the economy, second stochastic shocks on all endogenous variables and third commitment to a policy displaying no time ...
