Stocks of flies with known mutations are available for study, and their genome — which consists of only four pairs of chromosomes — has already been mapped. The traits of purebred, wild-type fruit flies have been well documented. These traits include large, oval-shaped bright red eyes, a single pair of fully developed wings, and a tan body with thin black stripes along the abdomen. Female fruit flies are slightly larger than male fruit flies. Female abdomens are elongated and rounded.

Compare the mutated flies to the normal flies. The fruit flies in this exhibit show just a few of the mutations that occur in natural fruit fly populations. The genetic instructions to build a fruit fly-or any other organism-are imprinted in its DNA, a long, threadlike molecule packaged in bundles called chromosomes.
