In recent years, there has been a steady increase in the publication of papers on the chemistry, biology, and potential clinical uses of marine glycosides. Indeed, more than half of the papers published in this field are less than a decade old. Glycosides have been isolated from species as diverse as algae, fungi, anthozoans, and echinoderms. Even fish of the genus *Pardachirus* produce glycosides, which they use as shark repellents. The major interest in these compounds as potential drugs stems from their broad spectrum of biological effects. They have been shown to have antimicrobial, antifungal, anti-inflammatory, immune modulatory, and anticancer effects. The anticancer effects of marine glycosides include cell cycle suppression, the induction of apoptosis, and the inhibition of migration, invasion, and metastasis, as well as antiangiogenesis. Marine glycosides influence membrane permeability and have been shown to influence membrane transport at the molecular level through effects on transport carriers and pumps, as well as effects on ligand-gated and voltage-gated channels. Various marine glycosides have been shown to activate sphingomyelinase and ceramide synthesis, to inhibit topoisomerase activity, receptor tyrosine kinase activity, and multidrug resistance protein activity, and to antagonize eicosanoid receptors. This Special Issue covers the entire scope of marine organism-derived glycosides that are of potential value as pharmaceutical agents or leads. These include, but are not limited to, tetracyclic triterpene glycosides, other triterpene glycosides, steroid glycosides, and glycosides of non-isoprenoid aglycones.

Arranged in five sections, this guide gives information on the hazards and types of safeguard available; explains what knowledge and experience the engineers need; explains the technical standards relevant to existing machines; and gives advice for manufacturers and suppliers of new machines.

?The objective of this book is to concisely present information with respect to appropriate use of experimental rodents in research. The principles elaborated seek to provide knowledge of the techniques involved in both management and scientific research to all who use laboratory animals, with a focus on the well-being and ethics regarding rodents and also to fortify the awareness of the importance of the animal as a study object and to offer orientation and assistance in conducting laboratory research, education or tests.

Conventional theories of capitalism are mired in a deep crisis: after centuries of debate, they are still unable to tell us what capital is. Liberals and Marxists both think of capital as an 'economic' entity that they count in universal units of 'utils' or 'abstract labour', respectively. But these units are totally fictitious. Nobody has ever been able to observe or measure them, and for a good reason: they don't exist. Since liberalism and Marxism depend on these non-existing units, their theories hang in suspension. They cannot explain the process that matters most – the accumulation of capital. This book offers a radical alternative. According to the authors, capital is not a narrow economic entity, but a symbolic quantification of power. It has little to do with utility or abstract labour, and it extends far beyond machines and production lines. Capital, the authors claim, represents the organized power of dominant capital groups to reshape – or creorder – their society. Written in simple language, accessible to lay readers and experts alike, the book develops a novel political economy. It takes the reader through the history, assumptions and limitations of mainstream economics and its associated theories of politics. It examines the evolution of Marxist thinking on accumulation and the state. And it articulates an innovative theory of 'capital as power' and a new history of the 'capitalist mode of power'.

"This publication and exhibition mark the third and last donation of 162 artworks from the late artist, Ng Eng Teng. The first two donations were made in 1996 and 1998. In all, he gave close to 1100 pieces ... his final benefaction, completed in 2001, included art by other well-known artists he had collected"--P. 1.

Biologically Active Natural Products: Pharmaceuticals demonstrates the connections between agrochemicals and pharmaceuticals and explores the use of plants and plant products in the formulation and development of pharmaceuticals. Experts from around the world examine a multitude of topics, including evaluation of extracts from tropical plants for p

The Nd:YAG laser has finally become the multidisciplinary and multispecialty tool of the 1980s. Primarily developed for gastrointestinal applications for controlling bleeding, at present it is also used for endoscopic treatment of gastrointestinal tumors, endobronchial cancer, and bladder and gynecological lesions and finding applications in otorhinolaryngology and neurosurgery. Development of laser scalpels and focusing head-pieces has now allowed the Nd:YAG laser to be used for open surgical procedures in general and plastic surgery, head and neck surgery, urology, gynecology, dermatology, and neurosurgery. The rapid development in ceramic

technology has led to contact surgery allowing physicians a choice of excision, vaporization, coagulation, incision, or combinations thereof by easily changing probes rather than having to select new laser wavelengths. This technology is rapidly replacing the carbon dioxide laser which currently has no adequate flexible waveguide for fiberoptic endoscopy, cannot be used in a water medium (e.g., bladder), and has poor coagulation properties when compared to the Nd:YAG laser. Future developments may see the Nd:YAG laser even replacing electro cautery in the operating room due to its greater safety and efficacy. Local hyperthermia (laserthermia) with computer control, photodynamic therapy, and ophthalmic applications make the Nd:YAG laser the most exciting technological advancement in medicine and surgery for the 1980s.

In the first section of this volume, we have attempted to bring together some of the papers that reflect exciting new areas of development in relation to neuroendocrine investigation. Very recently, specific nucleotide recognition sequences for thyroid hormones, steroid hormones and the fundamental intracellular regulator, cyclic AMP, have been determined. In this section, the preliminary characterization and investigation of the nuclear binding proteins that mediate the actions of cAMP are described. Not only does this represent an important advance in cell biology, but it may represent a further level of alteration in control in normal and disease states. Intercellular pituitary "cross talk" is well described in the in vitro setting. The active molecules are clearly It is now important able to exert significant actions at the subnanomolar level. to design experiments in order to define the precise physiological relevance of these novel and potentially important observations. Paracrine and autocrine cellular interactions are of established importance in growth control in a variety of body tissues. But it is only very recently that the investigation of normal and abnormal anterior pituitary growth has reached the forefront of neuroendocrine research. This is perhaps surprising, because the inhibitory effects of dopamine agonism on lactotroph growth and differentiation have been appreciated for some time. The anterior pituitary gland produces numerous growth factors that exert a variety of functional effects on pituitary hormone synthesis and release.
