Software-defined networking (SDN) is an architecture designed to make a network more flexible and easier to manage. SDN centralizes management by abstracting the control plane from the data forwarding function in the discrete networking devices.

network devices such as routers, switches, and gateways in your datacenter. You can use your existing SDN-compatible devices to achieve deeper integration between the virtual network and the physical network.

Software Defined Networking (SDN) | Microsoft Docs

Software-defined networking (SDN) technology is an approach to network management that enables dynamic, programmatically efficient network configuration in order to improve network performance and monitoring, making it more like cloud computing than traditional network management. SDN is meant to address the fact that the static architecture of traditional networks is decentralized and complex while current networks require more flexibility and easy troubleshooting.

Software-defined networking - Wikipedia

software-defined networking (SDN) Software-defined networking (SDN) is an architecture that aims to make networks agile and flexible. The goal of SDN is to improve network control by enabling enterprises and service providers to respond quickly to changing business requirements. In a software-defined network, a network engineer or administrator can shape traffic from a centralized control console without having to touch individual switches in the network.

control plane and the forwarding plane, aiming to simplify and improve network control. IT teams are more able to rapidly adapt to changing business requirements and application needs. SDN is a highly flexible, agile way to adapt to growing bandwidth requirements.

What is Software Defined Networking (SDN)? | Benefits of ...

Software-defined networking (SDN) is an approach to networking that uses software-based controllers or application programming interfaces (APIs) to communicate with underlying hardware infrastructure and direct traffic on a network.

What is Software-Defined Networking (SDN)? | VMware Glossary

Software-defined networking (SDN) is an approach to IT infrastructure that abstracts networking resources into a virtualized system. SDN separates network forwarding functions from network control functions with the goal of creating a network that is centrally manageable and programmable.

What is software-defined networking? - Red Hat

1) Network programmability: SDN enables network behavior to be controlled by the software that resides beyond the networking devices that provide physical connectivity. As a result, network operators can tailor the behavior of their networks to support new services, and even individual customers.

As an approach, SDN is evolving over the time. Talking of implementation, as its name suggests, SDN is implemented through software. Since SDN is a software layer, it provides advantages such as reduced manual efforts, dynamic scalability, and central management of network devices.

Software Defined Networking (SDN) explained for beginners

Software-defined networking (SDN) uses a controller to manage the devices. The controller is able to inventory hardware components in the network, gather network statistics, make routing decisions based on gathered data, and facilitate communication between devices from different vendors.

The software-defined wide area network (SD-WAN) is a natural application of SDN that extends the technology over a WAN. While the SDN architecture is typically the underpinning in a data center or...

What is SDN and where software-defined networking is going ...

Software-defined networking (SDN) is a newly emerging computer networking architecture. Its main distinguishing factor is the separation of the data plane from the control plane in routers and switches. In other words, the control is decoupled from hardware and implemented in software.

What is Software-Defined Networking (SDN)? - Definition ...

An SDN controller is an application in a software-defined networking (SDN) architecture that manages flow control for improved network management and application performance. The SDN controller platform typically runs on a server and uses protocols to tell switches where to send packets.
